

10/507499
DT04 Rec'd PCT/PTO 13 SEP 2004

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A multi-partitioned tubes of a synthetic resin tubular container having the cross-section of a ring and comprising:
at least a peelable portion-(6) extending over some peripheral length in a certain range of the ring cross-section and comprising an inner layer-(2) and an outer layer (3) detachably laminated with each other; and
at least an adhered portion-(7) occupying the rest of the ring and comprising said inner layer-(2) and said outer layer-(3) undetachably laminated with each other, wherein said inner layer-(2) breaks away from the outer layer-(3) of said peelable portion-(6) to form a partition wall or walls-(8) that allow inner space-(9) to be divided into compartments.
2. (Currently Amended) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 1, wherein the inner layer-(2) and the outer layer-(3) are molded from synthetic resins that are highly compatible with each other, wherein the peelable portion (6)-comprises the inner layer (2)-and outer layer (3)-laminated with each other through the intermediary of an adhesive layer-(4) that is laminated undetachably to either one of the inner layer-(2) or the outer layer-(3) but is laminated detachably to the other one thereof, and wherein the adhered portion-(7) is formed by directly laminating the inner layer-(2) and the outer layer-(3) to each other.

3. (Currently Amended) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 1, wherein the inner layer-(2) and the outer layer-(3) are molded from synthetic resins that are scarcely compatible with each other, wherein the peelable portion-(6) comprises said inner layer-(2) and said outer layer-(3) directly laminated with each other, and wherein the adhered portion-(7) has said inner layer-(2) and said outer layer-(3) laminated undetachably with each other through the intermediary of an adhesive layer-(4).

4. (Currently Amended) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 1 ~~Claim 1, 2, or 3~~, wherein a half peripheral length on either right or left side of the ring cross-section is used as the peelable portion-(6) and wherein the inner layer-(2) breaks away from the outer layer-(3) of said peelable portion-(6) to form a partition wall-(8) that consists of said peeled inner layer-(2) and allows the inner space-(9) to be divided into two compartments.

5. (Currently Amended) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 1 ~~Claim 1, 2, or 3~~, wherein the peelable portions-(6) are disposed on both sides of the ring over some peripheral lengths in certain ranges of the ring cross-section and wherein the inner layer (2)-breaks away from the outer layer-(3) of each peelable portion-(6) to form two partition walls-(8) that consist of said inner layer-(2) and allow the inner space-(9) to be divided into three compartments.

6. (New) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 2, wherein a half peripheral length on either right or left side of the ring cross-section is used as the peelable portion and wherein the inner layer breaks away from the

outer layer of said peelable portion to form a partition wall that consists of said peeled inner layer and allows the inner space to be divided into two compartments.

7. (New) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 3, wherein a half peripheral length on either right or left side of the ring cross-section is used as the peelable portion and wherein the inner layer breaks away from the outer layer of said peelable portion to form a partition wall that consists of said peeled inner layer and allows the inner space to be divided into two compartments.

8. (New) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 2, wherein the peelable portions are disposed on both sides of the ring over some peripheral lengths in certain ranges of the ring cross-section and wherein the inner layer breaks away from the outer layer of each peelable portion to form two partition walls that consist of said inner layer and allow the inner space to be divided into three compartments.

9. (New) The multi-partitioned tubes of a synthetic resin tubular container, according to Claim 3, wherein the peelable portions are disposed on both sides of the ring over some peripheral lengths in certain ranges of the ring cross-section and wherein the inner layer breaks away from the outer layer of each peelable portion to form two partition walls that consist of said inner layer and allow the inner space to be divided into three compartments.
